

Exchequer Tools

Tools for Exchequer Integration or Migration

All **Exchequer Tools** have been built from the ground up with performance in mind.

Fast, easy to use, ExSync makes integration to other business systems possible.

One of the main issues in migration from Exchequer is the conversion of data and potential loss of valuable historical data in the process.

All date/time and floating point fields are converted, getting the data into a usable format for other systems.

ExSync is a standalone application designed to provide fast data access from Pervasive SQL directly through ODBC. It then converts the data and moves it to the respective database.

ExSync converts Advanced Exchequer data and writes it into either the industry standard **Microsoft SQL Server** or **Oracle MySQL**. It has no dependencies on the Exchequer DLL for exporting data.

ExSync is a multi-threaded application. This allows it to connect to many tables, synchronising multiple streams of data simultaneously. The ExSync engine has the capability of moving **millions** of records an hour.

The **only** limitation on this is the central processing unit (CPU) and memory of the host machine (Server or PC).

To power our solutions we recommend **IBM** products. IBM System Intel servers provide cost effective, robust hardware with powerful performance and scalability with excellent support.

- Fast Synchronisation
- Accurate Data Conversion
- Replicated Exchequer Table Structure
- Simple Scheduler for Synchronisation
- Easy Interface
- Server or PC Application
- Access to All Database Fields

Data conversion and synchronisation to either:

MS SQL Server
Oracle MySQL

- Only 1 Pervasive license used
- No Exchequer License Required
- 32bit Windows Application
