

Exchequer Tools

Tools for Exchequer Integration or Migration

Total Integration: A middle tier technology that revolutionises Exchequer data exchange with any other business system.

"Fully integrated e-commerce with orders written directly into Exchequer as sales quotations or sales orders respecting customer currency types, discount matrix and credit control."

ExWeb is a framework designed to both extract data from Exchequer and Import data to Exchequer. It is easily customisable so that data can be extracted, manipulated and pushed to either Exchequer or any other database system.

Unlike any other product it is a fully functional task managed scheduler that executes task threads to process data at lightening speeds.

Tests have shown that 200 orders can be input into Exchequer in 15 seconds.

There are no text files or xml or temporary documents to worry about. As long as there is a network connection between web server and data server the system works. When connectivity is lost the orders queued up on the web server and are downloaded on the next polling.

Exchequer Dynamics Limited

ExWeb converts Advanced Exchequer data and writes it into either the **Microsoft SQL Server** or **Oracle MySQL** out of the box. It requires ODBC and a COM toolkit license. Additionally, it can also be customised to

write to any other database system.

To power our solutions we recommend **IBM** products. They provide cost effective, robust hardware with powerful performance and scalability whilst offering excellent support.

ExWeb will free you from the constraints imposed by Exchequers own Import/Export tools, providing a fully integrated e-commerce solution with the flexibility to adapt to your changing business needs.
